MacBusiness Software
Ledger Suite

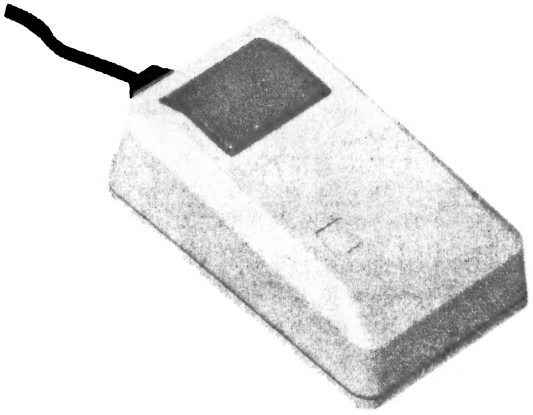
The Integrated Accounting System for the Macintosh™. Count on it.

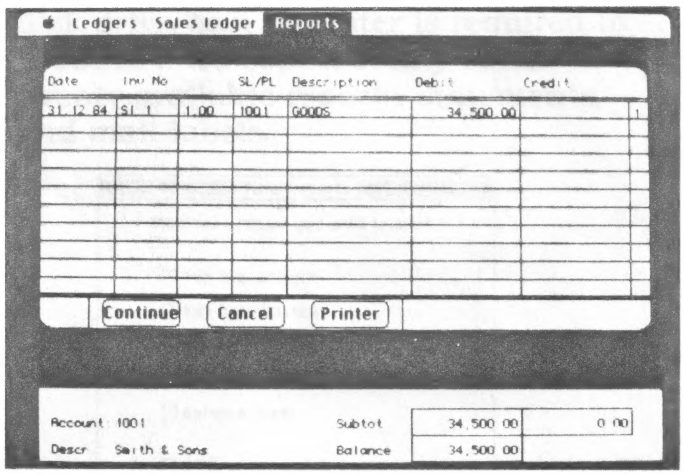
Introducing *MacBusiness*, the integrated accounting system designed for today's Australian businessman on today's most technologically advanced microcomputer, Apple's **Macintosh.**

MacBusiness, General Ledger, Accounts Receivable and Accounts Payable built into one interactive suite of programs, is the business accounting solution Australia has been waiting for. It fully employs the advanced concepts and features of the Macintosh to make *MacBusiness* the easiest to use, yet most powerful business tool of its kind available anywhere.

We invite you to test drive *MacBusiness* today. Literally, at the press of a button, within one hour you'll be gaining better financial control and better management of your accounts.

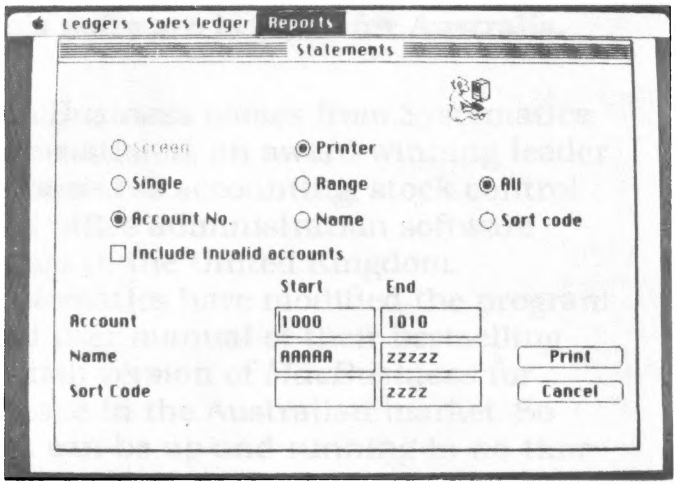
Learning to "point and click" with Macintosh's "Mouse" is fast and simple, and dramatically reduces the loss of valuable time in setting up your accounts and records. Unlike previous accounting programs, it completely eliminates the learning of unnecessary computer commands. That lets you spend your time where you need to, taking care of business.





What does MacBusiness do?

The General Ledger is the main and most important part of any accounting system. The Accounts Receivable ledger and Accounts Payable ledger are important sub-ledgers about your customers and suppliers, expanded from the General Ledger to give you detailed account management data. Together these produce up-to-the-minute Profit and Loss statements and Balance Sheets that tell you the trading position of your company and its overall financial state of affairs, important information when you need it in a hurry to increase competitiveness and profitability.



Using the *MacBusiness* Ledger Suite enables you to:

★ Better control debtors and creditors by aging and analysing them within minutes at the end of each month.

★ Produce statements of account, on demand, and immediately at the end of each month, together with automatic mailing labels.

★ Maintain all aspects of the Accounts Receivable, Accounts Payable and General Ledger.

★ Produce a Profit and Loss report/ Income Statement automatically.

★ Produce valuable sales and purchasing forecasts and statistics.

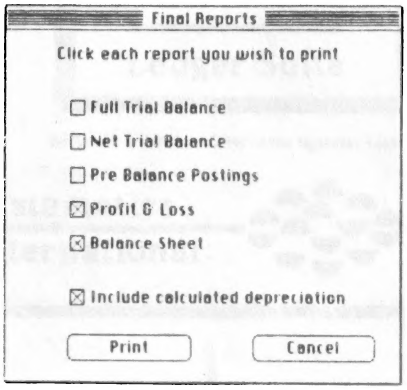
★ Produce a Balance Sheet easily and automatically.

★ Improve Cash Flow management.

★ Achieve full integration, to enable information from the Receivables and Payables to automatically update the General Ledger.

System Specifications.

MacBusiness is designed for small-to medium-sized companies. As such, it addresses the needs of the majority of Australian businesses. The software and utility programs are contained on two 3.5 inch disks, and run on either a standard 128K Macintosh or 512K "Fat Mac." Data is contained on a second disk drive, and a printer is required to produce hard copies of any of the twenty available reports, statements, and mail labels.



MacBusiness can also be easily loaded onto a hard disk. The system allows up to 199 General Ledger accounts, and as many as 800 debtors and creditors. One standard 400K data disk can hold 2992 transactions (depending on the combined number of accounts involved). A hard disk allows you to process as many as 15,600 transactions per megabyte.

Macintosh is a registered trademark of Apple Computer (Aust.) Pty. Ltd.

This software is made for Australia.

MacBusiness comes from Systematics International, an award-winning leader in business accounting, stock control and office administration software based in the United Kingdom. Systematics have modified the program and user manual of their bestselling British version of *MacBusiness* for release in the Australian market. So you can be up and running in no time at all.

Coming soon . . .

Similarly "Australianised" new additions to the *MacBusiness* suite will be available in the very near future. These include a multi-user invoicing module, and *MacBusiness Database*, a stand-alone data base product which can also be used to interrogate *MacBusiness* files to produce customised reports above and beyond its standard reports. Systematics also plan to create a version compatible with Lotus' *Jazz*.
